Greek Industry: Post Covid-19 Challenges

Anthony Bartzokas

Visiting Professor in Practise at the London School of Economics and Political Science and Associate Professor at the Department of Economics–University of Athens

Presentation at a Workshop organised by the Region of Western Greece on: Entrepreneurship Towards the 4th Industrial Revolution

31 March 2021

Global trends

- The severe economic shock triggered by the pandemic has generated an outpouring of public policy action around the world and the rapid crafting of trillion-dollar stimulus packages.
- Some of this action actually risks to hamper progress on mitigating climate change because it is predicated on supporting non-ecofriendly industries—the same industries that need to be drastically reformed to meet the climate goals.
- Levels of debt in the nonfinancial sector are higher than in 2007, as cheap and readily available funding encouraged borrowing.
- The crisis and the countercyclical lending role they are expected to play has put banking systems around the world under stress, having a differential impact depending on their characteristics and pre-crisis vulnerabilities.
- Borrower assistance measures exacerbated the stress for banks that operate in countries with little fiscal space. These
 vulnerabilities will need to be carefully monitored in the coming year as the pandemic continues to take its toll on the world
 economies.
- Firms with more cash, less debt, and larger profits experienced better performance than otherwise similar firms. As the pandemic
 depressed corporate sales and firms sought liquidity to cover costs, markets considered firms' cash reserves, leverage, and
 profitability when re-evaluating the value of corporations.
- Policy focus on credit provision, risks overburdening firms with debt, promoting inefficient use of resources, and engendering future leveraging problems.
- The combined effect of the pandemic and tougher environmental regulations is pulling capital expenditure in some of Europe's main industrial sectors in different directions with implications for corporate funding and credit quality.
- About 2 to 3 percent of GDP will be needed to close the equity gap in the EU and provide firms sufficient equity so they would no longer be in difficulty.

Winners and losers: Year-on-year revenue growth by industry segment

UNITED STATES			June '19 Revenue (USD B)	
Airlines		-24%	\$162	
Travel & Leisure		-18%	\$377

Greece: Economic Recovery Challenges

CONTEXT

- High potential for funding the real economy: Available funding sources of €80bn in 2021-2027
- Legacy issues: leveraged firms, investment gap, reduced profitability and insolvencies

OBJECTIVES

- Short term: The first post Covid-19 objective for the Greek industry would be to incentivise business investment back to the pre-economic crisis level (to 10% of GDP from 6% currently) and inventories to the pre-covid level (to 14% of sales from 12% currently)
- > Medium term: How to reconcile investment coordination priorities [Productivity Demand Institutions] is a challenge for involved stakeholders
- Long run: A green economy agenda, as a policy objective, will undoubtedly involve a transformation of production structures and economic activities and will enrich the economic complexity of the Greek economy

ALLOCATION

- Feeble development of capital markets, both public (listing) and private (private equity and venture capital)
- Limited role of institutional investors, risk capital and patient capital (e.g. pension funds)
- Financing of the real economy through debt (credit) rather than equity implies preference to tangible assets

CONSTRAINTS

- Previous experiences of **low efficiency** in the management of financial resources from EU financial programs in conjunction with the time constraints build in the EU Recovery Fund
- Limited long term investment capacity for infrastructure (including social infrastructure), SMEs, illiquid investment. The EU recovery plan is not a programme of national public expenditure
