Data does not speak for itself

INTRODUCTION

The numbers have no way of speaking for themselves. We speak for them. We imbue them with meaning.

— Nate Silver, *The Signal and the Noise*¹

The traditional statistics course

- Describing data with summary statistics
 - *dull*
- Probability theory for drawing random observation from a population distribution
 - *difficult and mathematical*
- Probability theory for distributions of summary statistics
 - *mathematical and incomprehensible*
- Formulae for statistical tests
 - *mathematical, unmotivated, just a bag of tools*
- (If lucky) Examples of using statistical models in real life.

A 'modern' statistical course

- Motivate by problem solving
- Start with visualisation and exploring data
- Focus on what can be reasonably learned from data, biases in data, concluding causation, etc
- Models and algorithms
- Assessing uncertainty through re-sampling data ('bootstrap')
- Probability theory as neat way of turning random variation into uncertainty about what is true
- Hypothesis testing and its potential problems
- Bayesian methods

All these rather abstract, challenging, ideas are there to help answer real questions

- The 'data cycle'
- eg PPDAC (promoted in New Zealand)

Are You a Data Detective?

Data detectives use PPDAC

Looking at data

What was the pattern of Harold Shipman's murders?

'I have nothing to hide'

Dr Harold Shipman, general practitioner,
on his arrest in September 1998

Shipman Inquiry July
2002:

215 definite victims,

45 probable

Looking at data

What was the pattern of Harold Shipman's murders?

- **Problem:** can more detail tell us more about what Shipman did?
- **Plan:** compare actual times at which his patients died with the times of deaths recorded by other local GPs
- **Data:** a huge exercise requiring examination of death certificates
- **Analysis:** simple plotting.....

People
die at all
hours

% of deaths in each hour of the day

People
die at all
hours

- but not
Shipman's
victims

Inference and bias

How many sexual partners have people in Britain had in their lifetime?

- **Problem:** cannot know this as a fact
- **Plan:** survey in which people are carefully asked about the sexual activity (Natsal)
- **Data:** reports of numbers of partners
- **Analysis:** plotting and summary statistics

How many sexual partners do people report?

Inference and bias

How many sexual partners have people in Britain really had in their lifetime?

Reported number of sexual partners in lifetime	Men aged 35–44	Women aged 35–44
Mean	14.3	8.5
Median	8	5
Mode	1	1
Range	0 to 500	0 to 550
Inter-quartile range	4 to 18	3 to 10
Standard deviation	24.2	19.7

- **Conclusions:** can we generalise this to the whole population?????

Induction: the stages in generalising from data

- **1 to 2.** How reliable are the reports?
- *Poor memory, social acceptability bias etc*
- **2 to 3.** How representative is the sample of those eligible for the study?
- *Random sampling of families (soup), 66% response*
- **3 to 4.** How close does the study population match the target population?
- *No people in institutions, etc*

Causation (or correlation)

The power of the press release....

Socioeconomic position and the risk of brain tumour: a Swedish national population-based cohort study

Amal R Khanolkar,^{1,2} Rickard Ljung,² Mats Talbäck,² Hannah L Brooke,² Sofia Carlsson,² Tiit Mathiesen,³ Maria Feychting²

- abstract:
 - *We observed consistent associations between higher socio-economic position and higher risk of glioma*
- press release
 - *High levels of education linked to heightened brain tumour risk*
- Daily Mirror...

APOCALYPSE WARNING: Insect population must be saved or ‘LIFE WILL DISAPPEAR’

A DECLINE in insect populations across the globe is a major “CRISIS” and it could spell the “disappearance of the foundation of life on Earth”, researchers have warned.

Plummeting insect numbers 'threaten collapse of nature'

Damian Carrington
Environment editor

@dpcarrington

Sun 10 Feb 2019 18.00 GMT

The world's insects are hurtling down the path to extinction, threatening a “catastrophic collapse of nature's ecosystems”, according to the first global scientific review.

More than 40% of insect species are declining and a third are endangered, the analysis found. The rate of extinction is eight times faster than that of mammals, birds and reptiles. The total mass of insects is falling by a precipitous 2.5% a year, according to the best data available, suggesting they could vanish within a century.

Copy structure of Kaggle competition (currently over 59,000 entries)

Split data-base of 1309 passengers at random into
training set (70%)
test set (30%)

Unsurprising factors predict survival

A simple classification tree

How good is my algorithm?

- ‘Accuracy’ is a very crude way of judging an algorithmic prediction
- Better to use the probabilities provided
- If probability p is given to an event X (0,1), then the Brier score is $(X - p)^2$

Performance of a range of methods on the test set

Method	Accuracy (high is good)	Brier score (low is good)
Everyone has a 39% chance of surviving	0.639	0.232
All females survive, all males do not	0.786	0.214
Simple classification tree	0.806	0.139
Classification tree (over-fitted)	0.806	0.150
Logistic regression	0.789	0.146
Random forest	0.799	0.148
Support Vector Machine (SVM)	0.782	0.153
Neural network	0.794	0.146
Averaged neural network	0.794	0.142
K-nearest-neighbour	0.774	0.180

Who was the luckiest person on the Titanic?

- Karl Dahl, a 45-year-old Norwegian/Australian joiner travelling on his own in third class, paid the same fare as Francis Somerton
- Had the lowest average Brier score among survivors – a very surprising survivor
- He apparently dived into the freezing water and clambered into Lifeboat 15, in spite of some on the lifeboat trying to push him back.
- Hannah Somerton was left just £5, less than Francis spent on his ticket.

Statistical methods are not always used well..

Effect of a Resuscitation Strategy Targeting Peripheral Perfusion Status vs Serum Lactate Levels on 28-Day Mortality Among Patients With Septic Shock

The ANDROMEDA-SHOCK Randomized Clinical Trial

Glenn Hernández, MD, PhD¹; Gustavo A. Ospina-Tascón, MD, PhD²; Lucas Petri Damiani, MSc³; et al

Figure 2. Kaplan-Meier Estimates of Cumulative Mortality Within 28 Days Among Patients Treated With Peripheral Perfusion-Targeted Resuscitation vs Lactate Level-Targeted Resuscitation

No. at risk															
Lactate	212	192	168	160	152	148	140	135	134	133	130	124	122	120	120
Peripheral perfusion	212	182	171	164	159	155	152	152	148	146	142	141	139	138	138

The mysteries of the P-value...

- P-value: a measure of the conflict between the data and a 'null hypothesis' of no effect
- Specifically, P = probability of getting such an extreme result, were the null hypothesis true.
- *Not* the probability of the null hypothesis
- Traditional threshold of 5%, to declare 'statistically significant'
- Not significant does *not* mean 'no effect'
- If many tests, or crucial decision, use more stringent threshold

Rare example of accurate reporting of meaning of P-value

Science & Environment

Higgs boson-like particle discovery claimed at LHC

By Paul Rincon

Science editor, BBC News website, Geneva

🕒 4 July 2012 | [Science & Environment](#) | 💬 1665

They claimed that by combining two data sets, they had attained a confidence level just at the "five-sigma" point - about a one-in-3.5 million chance that the signal they see would appear if there were no Higgs particle.

So what did Andromeda find?

- *'Two-sided $P = 0.06$ '*
- i.e. the probability of observing such a big *improvement*, were there no effect, is 0.03
- Could say there is 97% confidence of improvement.
- So what is the authors' conclusion?

CONCLUSIONS AND RELEVANCE Among patients with septic shock, a resuscitation strategy targeting normalization of capillary refill time, compared with a strategy targeting serum lactate levels, did not reduce all-cause 28-day mortality.

Peripheral Perfusion Fails to Cut Septic Shock Mortality

— But showed improvements over lactate-guided resuscitation for some outcomes

COMMENT • 20 MARCH 2019

Scientists rise up against statistical significance

Valentin Amrhein, Sander Greenland, Blake McShane and more than 800 signatories call for an end to hyped claims and the dismissal of possibly crucial effects.

- Not against P-values
- Just their dichotomisation

When might a split into 'significant' / 'not-significant' be more reasonable?

- Where a **decision** has to be made, e.g.
 - Drug regulation
 - Monitoring the performance of a list of centres/hospitals/doctors – when to intervene?

Hypothesis testing

Could Harold Shipman have been caught earlier?

- Using mortality rates from local GPs, calculate how many deaths he would have been **expected** to observe each year, under the **null hypothesis** that his mortality rates were normal.
- Subtract **expected** from **observed** number to get **excess mortality**

(NB: Shipman Inquiry total of definite or probable victims:
189 female > 65, **55** male over 65)

Hypothesis testing

Could Harold Shipman have been caught earlier?

- But when to 'blow the whistle'?
- These are two possible types of error -
 - **Type I error:** falsely accuse an innocent person (the null hypothesis)
 - **Type II error:** miss someone with true increased risk
- Generally, we want to
 - control the probability of a Type I error at a low value (α)
 - collect enough data to make Type II errors rare (β)

Shipman: “Sequential probability ratio test” (SPRT)
older females would have set off ‘alarm’ in 1985, after only 40 deaths

Probability and Bayes

Bayes theorem

the initial odds for a hypothesis

x the *likelihood ratio*

= the final odds for a hypothesis

Bayes theorem

- Suppose 1,000 possible perpetrators of a crime, plus one suspect
- The initial odds that a suspect is guilty = $1 / 1,000$
- The 'likelihood ratio'
- $= \frac{\text{Pr}(\text{evidence} \mid \text{suspect guilty})}{\text{Pr}(\text{evidence} \mid \text{someone else did it})} = 1,000,000$
- After evidence is considered, final odds that a suspect is guilty

$$\frac{1,000}{1} \times \frac{1,000,000}{1} = \frac{1}{1,000}$$

Probability and Bayes

What is the probability that the skeleton in a Leicester car park was really Richard III?

A recent case

- On Saturday 25 August 2012, archeologists started digging in a car park in Leicester – the site of Grey Friars friary
- In a few hours they found their first skeleton

- This was later claimed to be Richard III

ARTICLE

Received 5 Aug 2014 | Accepted 21 Oct 2014 | Published 2 Dec 2014

DOI: 10.1038/ncomms6631

Identification of the remains of King Richard III

Turi E. King^{1,2}, Gloria Gonzalez Fortes^{3,4,*}, Patricia Balaesque^{5,*}, Mark G. Thomas⁶, David Balding⁶, Pierpaolo Maisano Delser¹, Rita Neumann¹, Walther Parson^{7,8}, Michael Knapp⁹, Susan Walsh^{10,11}, Laure Tonasso⁵, John Holt¹², Manfred Kayser¹¹, Jo Appleby², Peter Forster^{13,14}, David Ekserdjian¹⁵, Michael Hofreiter^{3,4} & Kevin Schürer¹⁶

$$\text{Likelihood ratio} = \frac{\text{probability of evidence, if skeleton were Richard III}}{\text{probability of evidence, if someone else}}$$

Suggested 'verbal equivalents' for bands of likelihood ratios

Value of likelihood ratio	Verbal equivalent
>1–10	Weak support for proposition
10–100	Moderate support
100–1000	Moderately strong support
1000–10,000	Strong support
10,000–1,000,000	Very strong
>1,000,000	Extremely strong

Standards for the formulation of evaluative forensic science expert opinion

Evidence	Likelihood ratio (conservative estimate)	Verbal equivalent
Radiocarbon dating AD 1456–1530	2	Weak support
Age and sex of skeleton	5	Weak support
Scoliosis	212	Moderately strong support
Post-mortem wounds	42	Moderate support
mtDNA match	478	Moderately strong support
Y chromosome not matching	0.2	Weak evidence against
Combined evidence	6.5 million	More than extremely strong support

Researchers claimed at least 0.999994 probability that they had found Richard III

Britons having sex less often

National Survey of Sexual Attitudes and Lifestyles finds frequency of sex has fallen by 20% since last survey in 2000

When I said all this in a talk....

🏠 > Science

Britons are having less sex, and Game of Thrones could be to blame, warns Cambridge professor

David Spiegelhalter, the Winton Professor of the Public Understanding of Risk, said the trend in declining sex rates over the last 30 years was 'very worrying.'

In 1990 couples had sex around five times a month, but now it is just three times, a 40 per cent decrease in just 20 years. If current trends continue couples would not be having sex at all by 2030.
