

**“A crisis like no other? Unmet needs in health care during the first wave of the COVID-19 crisis in Austria” by Schmidt, Rodrigues, Simmons and Steiber**

# Summary

- Data: a representative (population) survey in June 2020 of 2000 Austrians, and data from Austrian portion of the European Social Survey in 2015.
- Outcomes: Subjective Unmet Need (SUN) in health care compared between 2015 and 2020 and analysis of the determinants of SUN in 2020.
- Covariates: education/labour market status/ age/SAH, financial situation (“difficult managing”)
- Analysis: Multinomial logit analysis of SUN for determinants of different types of SUN

# Results

Table 1: SUN in 2015 and 2020, by selected groups and type of SUN

	Total SUN 2015 (a)	Total SUN 2020 (b)		non-COVID-19 SUN 2020 (c)		Excess SUN COVID-19 (b)-(c) p.p.
	%	%	p-value (b)-(a)	%	p-value (c)-(a)	
Total population	5.90	20.07	<0.001	3.99	0.026	16.08
Education						
Primary	4.89	20.74	<0.001	7.14	0.406	13.60
Secondary	6.24	21.55	<0.001	3.65	0.012	17.90
Tertiary	6.05	16.95	<0.001	3.27	0.062	13.68
Labour market						
Employment	4.66	16.65	<0.001	3.46	0.178	13.19
Unemployment	11.50	25.65	0.036	7.70	0.442	17.95
Inactivity	8.63	28.51	<0.001	4.54	0.145	23.97
Retirement	3.86	36.58	<0.001	4.40	0.863	32.18

# Results

Panel (c): Interaction between SRH status and employment status

# Discussion

- Comparison of COVID/non-covid SUN is a strong element of paper – shows changes with “normal” (2015)
- Fear of infection seems to play a small role – how does this match emergency care utilisation patterns?
- Age important: why no over 65s? What is average healthcare utilisation for younger patients (eg under 40)? Why do they report SUN?
- Intro states that 80% of hip/knee replacement procedures were cancelled in April 2020. Seems plausible this explains pattern of results
  - Older patients more affected
  - Labour market “inactive” people more affected (can’t work due to disability)
  - Unemployment/income plays little role (unemployment affects young), income plays a different role to cancellation of services – price signal/private care didn’t play a role here.

# Suggestions for improvement

- Very clearly written and explained paper
- Clarify interpretation of MNL models: use binary outcomes for covid need?
- Explanation for no age gradient in health care utilisation – routine check ups?
- Use of 2015 ESS and 2020 survey is questionable – need a more robust defence.
  - Comparison of demographics in 2020/2015.
  - Comparison of outcomes eg non-COVID SUN (are there other outcomes that aren't reported here that are comparable between 2015/2020)
