TSSL Members

- Mona Azadkia Assistant Professor
- Yining Chen Associate Professor
- Piotr Fryzlewicz Professor
- Kostas Kalogeropoulos Associate Professor
- Clifford Lam Professor
- Xinghao Qiao Associate Professor
- Chengchun Shi Assistant Professor
- Tengyao Wang Associate Professor
- Qiwei Yao Professor

.

General Research Focus

- Theoretical developments and practical applications of various time series and statistical learning problems.
- Develops statistical methods in high-dimensional inference and dimension reduction for various kinds of data.
- E.g. panel and tensor time series data, inferential analysis on dynamic networks and spatio-temporal processes, functional data analysis, functional time series analysis, shape-constrained estimation, change-point detection and multiscale modelling and estimation for high dimensional non-stationary time series.

Research highlight - Dr Mona Azadkia

- Mona's research focuses on developing new methodologies to understand and quantify the dependency structure in data.
- Finding interpretable measures of the degree of dependence between the variables is a fundamental task in Statistics. Such measures are the core ingredient of many areas, such as variable selection, dimensionality reduction, sensitivity analysis, and causal inference.

Dr Mona Azadkia Dr Yining Chen Prof Clifford Lam Dr Chengchun Shi Dr Tengyao Wang Prof Qiwei Yao

Research highlight - Dr Mona Azadkia

- Mona is also working on a generalization of this problem, measuring conditional dependence and the hypothesis testing problem of conditional independence with applications in causal inference and graphical models. She is also interested in non-parametric statistics and problems in high-dimension.
- Before joining LSE, Mona earned her Ph.D. in Statistics at Stanford University in 2020 and was an FDS Postdoc Fellow at Seminar for Statistics at ETH Zürich.

- Tensor Time Series Analysis:
- E.g. (Economics) A study of fuel consumption: 3 different fuel types, 7 different types of cars in 12 cities ⇒ At time t, X_t ∈ ℝ^{3×7×12} is an order 3 tensor.
- Tensor factor model:

4日 > 4 回 > 4 回 > 4

Dr Mona Azadkia Dr Yining Chen **Prof Clifford Lam** Dr Chengchun Shi Dr Tengyao Wang Prof Qiwei Yao

Research highlight - Prof Clifford Lam

- High frequency data analysis: Market microstructure noise modelling for e.g. in portfolio allocation, integrated volatility + risk estimation
- Spatial Econometrics: Estimation of spillover effects from data a type of network effects.
- Current projects include: Tensor factor model estimation including rank estimation, time-varying spatial weight matrix in spatial lag models as semiparametric time series factor model.

Applications in mHealth

- An emerging area that uses smart phones, computer tablets or wearable devices in healthcare
- Examples: management of type-I diabetes (Shi et al., 2022); intern health study (NeCamp et al., 2020; see also the figure on the right)
- Objective: develop RL algorithms to learn data-adaptive treatment interventions to improve subjects' health conditions

Topics

- **Objectives**: policy learning, policy evaluation (causal inference, A/B testing), model validation/selection
- Data: high-dimensional, massive, non-markovanity, doubly inhomogeneous (e.g., nonstationary over time & heterogeneous over population), multi-relational, nonregular, unmeasured confounding

Sparse signal detection

Research area: identifying sparse signal in high-dimensional data

- High-dimensional statistics study data whose dimension is of comparable order or even larger than the number of observations.
- High-dimensional data typically possess some low-dimensional structure
- The challenge is to develop a method that can identify and aggregate over such low-dimensional signal.

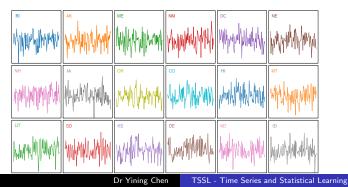

Dr Mona Azadkia Dr Yining Chen Prof Clifford Lam Dr Chengchun Shi **Dr Tengyao Wang** Prof Qiwei Yao

Research highlight - Dr Tengyao Wang

An example: sparse change detection

- Weekly standardised excess death numbers in US states between Jan 2017 and Dec 2018.
- Anything unusual?

Research highlight - Dr Tengyao Wang

An example: sparse change detection

- Weekly standardised excess death numbers in US states between Jan 2017 and Dec 2018.
- Bad flu season in 2017 causing a spike in death numbers in a few states

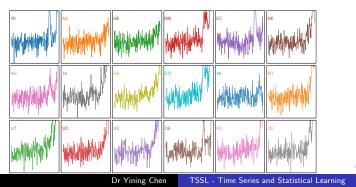

Dr Mona Azadkia Dr Yining Chen Prof Clifford Lam Dr Chengchun Shi **Dr Tengyao Wang** Prof Qiwei Yao

Research highlight - Dr Tengyao Wang

An example: sparse online change detection

- Weekly standardised excess death numbers in US states between Jan 2017 and Dec 2020
- Declare change as soon as possible when there is a disease outbreak

Some research topics

Some research topics on sparse signal detection

- Sparse PCA: $X_1, \ldots, X_n \stackrel{\text{iid}}{\sim} N_p(0, \Sigma)$, where the leading eigenvector v of Σ is sparse. How do we estimate v?
- High-dimensional clustering: high-dimensional observations X₁,..., X_n, when restricted to some (unknown) low-dimensional subspace, are distributed as mixture of Gaussians. How do we perform classification? Clustering? Semi-supervised learning?
- ► High-dimensional changepoints: $X_1, \ldots, X_z \stackrel{\text{iid}}{\sim} N_p(\mu_1, \Sigma)$ and $X_{z+1}, \ldots, X_n \stackrel{\text{iid}}{\sim} N_p(\mu_2, \Sigma)$ with $\theta = \mu_1 \mu_2$ sparse. How do we test if $\theta = 0$? Estimate θ ? Estimate z? Do it in an online algorithm?
- Two sample testing of regression coefficients: $Y_1 = X_1\beta_1 + \epsilon_1$, $Y_2 = X_2\beta_2 + \epsilon_2$. Difference between two regression coefficients $\theta = \beta_1 - \beta_2$ is sparse. How do we test $\theta = 0$? Estimate θ ?

Research highlight - Prof Qiwei Yao

Distinctive feature of TS data: Dependence across times makes data analysis more <u>exciting</u> and <u>challenging</u>, and <u>future forecasting</u> possible.

Challenges:

- 1. Complex and high-dimensional data
- 2. Serial dependence in addition to cross-sectional dependence
- 3. Non-stationarity
- 4. Dependence beyond linear correlations

Prerequisite: Solid background in Mathematical Statistics/Mathematics

- Creativity in developing machine/statistical learning methods/algorithms
- Complex programming

Some past and on-going projects:

- Independent component analysis for high-D TS, matrix TS, or high-D random fields
- Dimension-reduction and factor modelling for high-D TS, or spatialtemporal processes
- Testing for high-D white noise
- Cointegration for high-D TS
- Intrinsic spatial processes and spatial cointegration
- High-D unit-root tests
- AR(1) dynamic network models
- Matrix TS modelling based on tensor CP-decomposition
- Clustering high-D TS based on cluster-specific factors
