

Course information 2020-21

MT2176 Further calculus (half course)

General information

COURSE LEVEL: 5

CREDIT: 15

NOTIONAL STUDY TIME: 150 hours

Summary

This half course provides students with useful techniques and methods of calculus and enables students to understand why these techniques work. Throughout, the emphasis is on the theory as well as the methods.

Conditions

Prerequisite: If taken as part of a BSc degree, the following course(s) must be passed before this course may be attempted:

- MT1174 Calculus **OR** MT1186 Mathematical methods

Exclusions: You may not register for this course in the same year as:

- MT3095 Further mathematics for economists

Aims and objectives

The objectives specifically include:

- enable students to acquire further skills in the techniques of calculus,
- enable understanding of the principles underlying the subject of calculus,
- prepare students for further courses in mathematics and/or related disciplines (e.g. economics, actuarial science).

Learning outcomes

At the end of the course and having completed the essential reading and activities students should be able to:

- demonstrate knowledge of the subject matter, terminology, techniques and conventions covered in the subject,
- demonstrate an understanding of the underlying principles of the subject,
- demonstrate the ability to solve problems involving an understanding of the concepts.

Please consult the current EMFSS Programme Regulations for further information on the availability of a course, where it can be placed on your programme's structure, and other important details.

Essential reading

For full details, please refer to the reading list

Adam Ostaszewski *Advanced Mathematical Methods*. (Cambridge: Cambridge University Press, 2008) [ISBN 978-0521289641]

Ken Binmore and Joan Davies *Calculus: Concepts and Methods*. (Cambridge (Cambridge: Cambridge University Press, 2002) second edition [ISBN 978-0521775410]

Assessment

This half course is assessed by a two-hour unseen written examination.

Syllabus

This course follows on from Calculus and Algebra, and continues further the study of calculus techniques and theory. The course will develop further the theory of functions, and will also include some new practical skills, such as how to evaluate double integrals and how to use Laplace transforms to solve differential equations.

Functions of one variable: Limits; continuity; differentiability; Taylor's Theorem; L'Hôpital's rule.

The Riemann integral: The definition of the Riemann integral; the Fundamental Theorem of Calculus.

Improper integrals: The definition of an improper integral; tests for the convergence of an improper integral with a positive integrand (including the direct comparison test and the limit comparison test); absolute convergence of improper integrals with an integrand of variable sign.

Double integrals: Double integrals; repeated integrals; change of variable techniques.

Manipulation of integrals: Joint continuity and the manipulation of proper integrals; dominated convergence and the manipulation of improper integrals; the Leibniz rule for differentiating an integral.

Laplace transforms: The definition of the Laplace transform; functions of at most exponential growth; standard Laplace transforms; properties of the Laplace transform; the Gamma function; using Laplace transforms to solve differential equations; convolutions and the Convolution Theorem; the Beta function.

Please consult the current EMFSS Programme Regulations for further information on the availability of a course, where it can be placed on your programme's structure, and other important details.
