

# Course information sheet 2023-24

## ST1215 Introduction to mathematical statistics

### General information

**COURSE LEVEL:** 4

**CREDIT:** 30

**NOTIONAL STUDY TIME:** 300 hours

### Summary

The course provides a precise and accurate treatment of probability, distribution theory and statistical inference at the introductory level.

### Conditions

**Exclusions:** Students cannot take this course with:

- ST104a Statistics 1
- ST104b Statistics 2

### Aims and objectives

The course provides a precise and accurate treatment of introductory probability and distribution theory, statistical ideas, methods and techniques. Topics covered are data visualisation and descriptive statistics, probability theory, random variables, common distributions of random variables, multivariate random variables, sampling distributions of statistics, point estimation, interval estimation, hypothesis testing, analysis of variance (ANOVA) and linear regression.

### Learning outcomes

At the end of this course, and having completed the Recommended reading and activities, students should be able to:

- compute probabilities of events, including for univariate and multivariate random variables
- apply and be competent users of standard statistical operators and be able to recall a variety of well-known probability distributions and their respective moments
- derive estimators of unknown parameters using method of moments, least squares and maximum likelihood estimation techniques, and analyse the statistical properties of estimators
- explain the fundamentals of statistical inference and develop the ability to formulate the hypothesis of interest, derive the necessary tools to test this hypothesis and interpret the results in a number of different settings
- be familiar with the fundamental concepts of statistical modelling, with an emphasis on analysis of variance and linear regression models

Please consult the current EMFSS Programme Regulations for further information on the availability of a course, where it can be placed on your programme's structure, and other important details.

- demonstrate understanding that statistical techniques are based on assumptions and the plausibility of such assumptions must be investigated when analysing real problems.

## Employability outcomes

Below are the three most relevant skill outcomes for students undertaking this course which can be conveyed to future prospective employers:

1. Complex problem-solving
2. Decision making
3. Communication

## Recommended reading

All essential reading is provided within the course materials. A recommended textbook for additional exposition and practice problems is:

- Larsen, R.J. and M.J. Marx (2017) *An Introduction to Mathematical Statistics and Its Applications*, Pearson Education, 6<sup>th</sup> edition.

## Assessment

This course is assessed by a three-hour unseen written examination.

## Syllabus

**Data visualisation and descriptive statistics:** Basics of data visualisation; Common measures of central tendency and dispersion.

**Probability theory:** Set theory: the basics; Axiomatic definition of probability; Classical probability and counting rules; Conditional probability and Bayes' theorem.

**Random variables:** Discrete random variables and their properties; Continuous random variables and their properties.

**Common distributions of random variables:** Common discrete distributions; Common continuous distributions.

**Multivariate random variables:** Joint probability functions; Marginal distributions; Conditional distributions; Covariance and correlation; Independent random variables; Sums and products of random variables.

**Sampling distributions of statistics:** Random samples; Statistics and their sampling distributions; Sampling distribution of a statistic; Sample mean from a normal population; The central limit theorem; Some common sampling distributions; Prelude to statistical inference.

**Point estimation:** Estimation criteria: bias, variance and mean squared error; Method of moments estimation; Least squares estimation; Maximum likelihood estimation; Asymptotic distribution of maximum likelihood estimators.

**Interval estimation:** Interval estimation for means of normal distributions; Approximate confidence intervals; Use of the chi-squared distribution; Interval estimation for variances of normal distributions.

**Hypothesis testing:** Setting  $p$ -value, significance level, test statistic;  $t$  tests; General approach to statistical tests; Two type of error; Tests for variances of normal distributions; Comparing two normal means with paired observations; Comparing two normal means; Tests for correlation coefficients; Tests for the ratio of two normal variances.

**Analysis of variance:** One-way analysis of variance; Two-way analysis of variance.

Please consult the current EMFSS Programme Regulations for further information on the availability of a course, where it can be placed on your programme's structure, and other important details.

**Linear regression:** Simple linear regression; Inference for parameters in normal regression models; Regression ANOVA; Confidence intervals for  $E(y)$ ; Prediction intervals for  $y$ ; Multiple linear regression models.

Please consult the current EMFSS Programme Regulations for further information on the availability of a course, where it can be placed on your programme's structure, and other important details.
